Heliostat (hē'li-os-tat), n. [Gr. hēlios, the sun, and statos, fixed, from histēmi, to stand.]

A name which is given to various contrivances for reflecting the sun's light either temporarily or continuously to an observer at a distance. The simplest heliostat is a mirror hung up at a distant station so as to reflect a flash to the observer whose station may be many miles from it. This mirror is generally so adjusted that the flash occurs exactly at some orearranged hour, and by exactly at some prearranged hour, and by being in readiness the observer can get an observation with precision as regards time. Some heliostats are visible for 80 miles. By Some heliostats are visible for 30 miles. By being fitted with an adjustment of clockwork, the mirror can be made to revolve with the sun, and so to reflect a beam of sunlight steadily in one direction, being then called also heliotrope. The heliostat has been used for signalling in war.

light. Heliotype (hē'li-o-trp), n. [Gr. hēlios, the sunand E. type.] 1. A photographic process by which pictures can be printed in the same manner as lithographs, depending on the fact that a dried film of gelatine and bi-chromate of potash, when exposed to light, is afterwards insoluble in water, while the chromate of potash, when exposed to light, is afterwards insoluble in water, while the portion not so exposed swells when steeped. A mixture of gelatine, bichromate of potash, chrome alum, and water is poured on a plate of glass, where it shortly settles into a film. When dried the film contracts and separates from the glass. A picture is then printed on it from a negative, after which it is attached to a plate of zine, and copies are taken from it by inking it with lithographic ink exactly as in the ordinary lithographic process. The films are technically called 'skins.' Sometimes a guttapercha mould is prepared from the film, and copper deposited on it by the electrotype process, the plate thus produced being printed from in the ordinary way.—2. A picture produced by this process. Heliotypography (heli-o-tip-og"ra-fi), n. [Gr. hēlios, the sun, hppos, type, and graphō, to write.] A photographic process by which the sun paints its own picture. The picture is first received on a glass plate rendered sensitive by collodion, whence it is transferred to a positive covered with a varnish of a complex chemical nature. Certain constituents of the varnish, which are more easily affected by the sun's actinic rays, are removed by chemical means, when the plate becomes a matrix or foundation, from which an electrotype can be taken, available either

Helium (heli-um), m. [Gr. helios, the sun.] An elementary substance which spectrum analysis (in 1868) showed to exist in the sun's chromosphere, and which has latterly been found in some rare minerals; very light, only 2-18 times as heavy as hydrogen.

It seems to have been proved that at least some sensible part of the light of the corona is a terrestrial atmospheric halo or dispersive reflection of the light of the glowing hydrogen and 'hetium' round the sun. Str W. Thomson.

Frankland and Lockyer find the yellow prominences to give a very decided bright line not far from D, but hitherto not identified with any terrestrial fame. It seems to indicate a new substance, which they propose to call helium.

Helix (he'liks), n. pl. Helices (hel'i-sez). [Gr., a winding, a convolution: applied to a [Gr., a winding, a convolution: appned to a snail from its convolutions.] 1. Herring (hering), n. [A. Sax. hæring, hæring, D. hæring, G. hæring, icel. hæringr, hering, The root meaning is probably seen in A. Sax. hære=G. hær, Goth. hæring, anny, a multitude, from the fish moving in shoals.] The name given to two distinct but closely allied species of malacopterygian fishes of the genus Clupea—C. hærengus and C. Leachii. The former is the common herring, and is too well known to require description. Its annual migration is not, as has been supposed, from a colder to a milder climate, but is probably from a deeper part of the ocean to a shallower. Impelled by the increasing burden of milt or roe, the herring leaves the deep water where it has passed the winter and spring months, and seeks the coast where it may deposit its ova, and where they may be exposed to the influences of oxygen, heat, and sun-light, which are essential to their development. They are generally followed by multitudes of hakes, dog-fishes, &c., and gulls and other sea-birds hover over the shoals. They swim near the surface, and are therefore easily taken by net. So great is their fecundity that the enormous number taken appears to produce no diminution of their abundance, as many as 68,000 eggs having been counted in the roe of one female. The to produce no diminution of their abundance, as many as 68,000 eggs having been counted in the roc of one female. The herring-fishery has been prosecuted in England since the beginning of the eighth century. Herrings are found from high northern latitudes to as low as the northern coasts of France. They are met with on the coast of America as low as Carolina, and they are found in the seas of Kamtschatka. C. Leachii is smaller than the common herring, but is deeper in body in proportion ring, but is deeper in body in proportion to its length. GENESIS, HOMOGENESIS.

Up to quite recent times it was believed . . . that all the various processes of multiplication observable in different kinds of organisms have one essential character in common; it was supposed that in every species the successive generations are alike. It has now been proved, however, that in plants, and in numerous animals, the successive generations are not alike; that from one generation there proceeds another whose members differ more or less in structure from their parents; that these produce others like themselves, or like their parents, or like neither, but that eventually the original form reappears. Instead of there betwindly the original form reappears, instead of there betwindly the original form reappears. Instead of the results of the same form. [Rare.] Holiness (hö'li-nes), n. 1. The state or quality of being holy or sinless; purity or integrity of moral character; freedom from sin; sanctity; the feeling of antipathy or repugnance to moral evil (see extract). Applied to the Supreme Being, holiness denotes perfect purity or integrity of moral character, one of his essential attributes.

character, one of his essential attributes.

Hotiness suggests the idea, not of perfect virtue, but of that peculiar affection wherewith a being of perfectivitue regards moral evil; and so much indeed is this the precise and characteristic import of the term, that, had there been no evil, either actual or conceivable, in the universe there would have been no hotiness. There would have been perfect truth and perfect righteousness, yet not hotiness; for this is a word which denotes neither any one of the virtues in particular, nor the assemblage of them all put together, but the recoil or the repulsion of these towards the opposite vices—a recoil that never would have been felt, if vice had been so far a nonentity as to be neither an object of real existence nor an object of thought.

Homogeneous (hō-mō-jē'nē-us), a. [Fr. homogène; Gr. homogenės—homos, like, and
genos, kind.] Of the same kind or nature;
consisting of similar parts, or of elements
of the like nature; as, homogeneous particles, elements, or principles; homogeneous
lodies.

Boules.

In no country has the enmity of race been carried farther than in England. In no country has the enmity been more completely effaced. The stages of the process by which the hostile elements were melted down into one homogeneous mass are not accurately known to us.

Homogenesis (hō-mō-jen'e-sis), n. [Gr. homos the same, and genesis, birth.] In Homogenesis (ho-mo-jen'e-sis), n. [67]. homos, the same, and genesis, birth.] In physiol, the doctrine that the offspring of an animal or plant run through the same cycle of existence as the parent, as opposed to heterogenesis or zenogenesis, which maintains that the offspring of certain organisms run through a totally different series of states from those of the parent. See Brogenesis, Heterogenesis.

GENESIS, HETEROGENESIS.

Homogenetic (hô'mō-jē-net'ik), a, A term applied to that class of homologies which arise by identity of the structures, and which the evolutionists contend are evidences of common ancestry.

Homogens (hô'mō-jenz), n, pl. [Gr. homogenës, of the same family or race—homos, the same, and genos, race.] A name given by Lindley to a group of exogenous plants which have their wood arranged in the form of a series of wedges instead of concentric circles, as in the stems of peppers, aristolochias, &c. lochias &c

Homogeny (hö-moj'e-ni), n. Joint nature.

Bacon.

Homograph (hō'mō-graf), n. [Gr. homos, the same, and graphō, to write.] 1. In philol. a word which has exactly the same form as another, though of a different origin and signification; thus base the adjective and base the noun, fair the adjective and fair the noun, are homographs.—2. Mill. a system of telegraphic signals performed by means of a white pocket handkerchief. Worcester.

means of a white pocket handkerchief. Worsester.

Homographic (hō-mō-graf'ik), a. 1. In geom. a term applied originally to two figures so related that to any point in one only one point in the other corresponds, and vice versa; whilst to points situated in a line in either figure correspond collinear points in the other; also applied for a similar reason to rows of points, pencils of light, &c.—2. In orthography, relating to homography or to homography, relating the same character always to represent the same sound; as, a homographic alphabet.

Homography (hō-mog'n-fi), n. [Gr. homos, the same, and graphe, writing, from graphe, to write.] In orthography, the representation of each sound by a distinctive character, which is employed for that sound alone.

Homoloustan (hō-moj-oy-tō"ton), n. [Gr. homosos, like, and ptotos, falling.] In rhet. a figure in which the several parts of a sentence end with the same case or a tense of like sound.

like sound.

Homoiousian (hō-moi-ou'si-an), a. [Gr. homoiousias—homoios, similar, and ousia, being, from on, ousa, on, ppr. of einai, to be.] t. Having a similar nature—2. Relating to the Homoiousians or their belief.

Homoiousian (hō-moi-ou'si-an), a. One of a sect of Arians, followers of Eusebius, who maintained that the nature of Christ is not the same with, but only similar to, that of the Father, as distinguished from the Homoousians, who maintained that he was of the same nature. the same nature

Homoiozoic (hō'moi-ō-zō''ik), a. Same as

Homeozoie (hō-mol'o-gāt) at pret & pp. homologated; ppr. homologated; ppr. homologating. [L.L. homologa, homologating, from Gr. homologo, homologating, from Gr. homologo, homologating, from Gr. homologo, to assent, to agree—homos, the sime, and logos, discourse, from logo, to speak.] To approve of; to assent to; to ratify.

Homologation (hō-mol'o-gā-shon) a. The act of homologating; approval; ratification; specifically, in Scots law, a technical expression signifying an act by which a perse a approves of a deed, the effect of which a persen approves of a deed, the effect of which a persen approves of a deed, the effect of which a persen approves of a deed, the effect of which a persen by whom it is homologated.

ing to homology; having a structural affinity. See Homology.
Homologically (hō-mō-loj'ik-al-li), adv. In a homologicalla (hō-mō-loj'ik-al-li), adv. In a homological manner or sense.
Homologoumena, Homologumena, (hom'-b-lō-gou'mō-na), n. pl. (Gr. homologoumena, things conceded, pp. of homologou to agree, to admit, to concede. See Homologous] An epithet applied by Busebins to the generally acknowledged books of the New Testament, to distinguish them from the Antilegomena.
Homologous (hō-mol'og-us), a. (Gr. homos, similar, and logos, proportion, Having the same relative position, proportion, value, or structure: specifically, (a) in geom. corresponding in relative position and proportion. In similar polygons, the corresponding sides, an-

In similar polygons, the corresponding sides, angles, diagonals, &c., are homologous. Math. Dict. In similar polygons, the corresponding saces, and spales, diagonals, &c., are homologyus. Math. Dict.

(b) In alg. having the same relative proportion or value, as the two antecedents or the two consequents of a proportion. (c) In chem. being of the same chemical type or series; differing by a multiple or arithmetical ratio in certain constituents, while the physical qualities are analogous, with small differences, as if corresponding to a series of parallels; as, the species in the several groups of alcohols, fatty acids, and aromatic acids are homologous with the others in the same group. (d) In physiol. corresponding in type of structure; having like relations to a fundamental type; thus, the human arm, the foreleg of a horse, the wing of a bird, and the swimming-paddle of a dolphin or whale, being all composed essentially of the same structural elements, are said to be homologous, though they are adapted for quite different functions.

Homolographic (hom/ol-o-graf*/ik), a. [Gr. homolograf*/ik], a. [Gr. homol

or whate, being an composed essentially of the same structural elements, are said to be homologous, though they are adapted for quite different functions.

Homolographic (hom/ol-o-graf"ik), a. [Gr. homos, the same, like, holos, whole, and graphō, to write.] Maintaining or exhibiting the true proportions of parts; preserving true relations as to size and form.—Homolographic projection, that method of laying down portions of the earth's surface on a map or chart, so that the different portions of the surfaces delineated have their due relative size and form.

Homologue (hō'mol-og), n. [See Homologous; That which is homologous; that which has the same relative position, proportion, value, or structure; thus, the corresponding sides, &c., of similar geometrical figures are homologues; the members of a homologous series in chemistry are homologues; an organ agreeing in the plan of its structure with a corresponding organ in a different animal, though differing in function, is a homologue of this corresponding organ.—Homologue, Analogue. See ANALOCUE.

Homology (hō-mol'o-ji), n. [See Homologous; orrespondence; relation; as, the homology of similar polygons; specifically, in biology, that relation between parts which results from their development from corresponding embryonic parts, either in different animals, as in the case of the arm of man, the forecand hind legs in quadrupeds, and the segments or rings and their appendages of which the body of a worm, a centipede, &c., is composed. The latter is called serial homology. See Homologus (homomallous, Homomallous (hō-mologus, a lock of wool.) In bot. originating all round a stem, as leaves, and all bending or curving round to one side.

Homomorphism (hō-mō-morfixm), n. [See Homomorphous, or of having the same, and morphē, shape.] Having the same external appearance or form.

Memomorphous cauch families widely removed from

external appearance or form. See extract.

external appearance or form. See extract.

Many examples occur, both among animals and among plants, in which families widely removed from one another as to their fundamental structure, nevertheless present a singular, and sometimes extremely close, resemblance in their external characters. Homomorphous forms are found in different parts of the earth's surface. Thus, the place of the Cauti of South America is taken by the Euphorbiae of Africa; or, to take a zoological illustration, many of the different orders of Manmalia are represented in the single order Marsupialia in Australia. Nicholson.

Homonemeæ (hō-mō-nē'mē-ē), n. pl. [Gr. homos, the same, and nema, a thread.] A name given to the lower cryptogams propagated by spores, which put out threads of the same nature with the perfect plant.

Homony (ho'mo-ni), n. Same as Hominy. Homonym, Homonyme (hō'mo-nim), n. [Gr. homos, like, and onoma, name.] A word which agrees with another in sound, and perhaps in spelling, but differs from it in signification; a word that is the name of more than one object; as, the substantive bear and the verb bear.

bear and the Vern vew.

Where so many names are given to a single object, some would almost of necessity be applicable to other objects as well, and thus be homozymes.

Homopetalous (hō-mō-pet'al-us), a. [G. homos, the same, like, and petalon, a petal.] In bot having all the petals formed alike; having all the florets alike in a composite

nower. Homophone (hō'mō-fōn), n. [Fr., from Gr. homos, the same, and phōnō, sound.] 1. A letter or character expressing a like sound with another.—2. A word or root having the same sound as another but differing in

with another.—2. A word or root having the same sound as another but differing in meaning and probably in spelling; a homonym; thus, air and heir, all and awl, bare and bear, are homophones.

Homophonous (hō-mof'on-us), a. 1. Of the same pitch; of like sound; unisonous; specifically, in philol. agreeing in sound but differing in sense.—2. Expressing the same sound or letter with another; as, a homophonous hieroglyphic.—Homophonous words or syllables, words or syllables having the same sound, although expressed in writing by various combinations of letters.

Homophony (hō-mof'on-i), n. [Gr. homos, like, and phōnē, sound.] 1. Sameness of sound.—2. In Greek music, music performed in unison, in opposition to antiphony.

Homoplastic (hō-mō-plas'tik), a. [Gr. homos, the same, and plastikos, from plassō, to mould.] In biology, a term applied to those homologies which arise in consequence of tissues similar in character being subjected to similar influences. Such homologies may arise between groups whose common ancestry is too remote to be credited with the transmission of the characters.

Romopter (hō-mop'ter), n. A member of the Homoptera, (hō-mop'ter-a), n. pl. [Gr. homos, similar, and pteron, a wing.] One of the

Homoptera-Cicada Diardi,

sections into which the order of hemipterous sections into which the order of hemipterous insects has been divided, the other section being the Heteroptera. The insects of this section have the wing-covers generally defexed, of the same consistence throughout, the antennæ mostly short and terminated by a bristle, and the body convex and thick. To this section belong the Aphidæ, Occidæ, Cicadidæ, Fulgoridæ, &c. By some na-

turalists the Homoptera are regarded as an independent order. See HEMIPTERA. Homopteran (hō-mopter-an), n. An individual of the Homoptera. Homopter-ous (hō-mopter-an), n. An individual of the Homoptera. Homopterous (hō-mor/ga-na), n. pl. [Gr. homos, the same, like, and oryanon, an organ.] A term applied to cryptogams, from their consisting of cells only without vessels. It is synonymous with Cellulares. Homostyled (hō-mō-stild), a. In bot, denoting species in which the individuals bear styles of the same length and character opposed to heterostyled. Darvoin.
Homotaxis (hō-mō-taks'is), n. [Gr. homos, the same, and taxis, arrangement.] The same arrangement; specifically, in gool, agreement in the arrangement in different localities of strata which occupy the same place or position in the stratified systems, but which may or may not be contemporaneous.

raneous. Homotonous (hō-mot'on-us), a. [Gr. homos, like, and tonos, tone.] Of the same tenor or tone; equable: applied to disenses which have a uniform tenor of rise, state, or de-

Honey (hun'i), n. [A. Sax. hunig, honey; O. Sax. honey, D. and G. honig, Icel. hunang, honey, 1]. A sweet, viscid juice, collected and elaborated from the flowers of plants by several kinds of insects, for the food of themselves and their progeny, especially by the honey-bee (Apis mellifica), by which it is deposited in the cells of a waxy structure built by this insect and known as honey-comb. The ordinary honey of our hives, when pure, is of a whitish colour tinged with yellow, sweet to the taste, of an agreeable smell, soluble in water, and becoming vinous by fermentation. It is said to contain four kinds of sugar including cane and fruit sugar, besides certain other substances. As honey-producing insects we may also mention a kind of wasy (Polybia apicipennis) and the honey-and of Mexico (Myrmecocyetus mexicanus).—2. Fig. sweetness or pleasantness.

diccious perennial indigenous to Britain, and a native also of Europe and Northern Asia. It requires to be cultivated with great care, and a full crop of hops is not produced till the fourth or fifth year after planting. The hops when mature are placked by hand and carried to a drying kith, dried, and packed into bags or pockets. In order to keep hops for two or three years they require to be powerfully compressed and put into much closer canvas bags than when they are to be immediately sent to market. The culture of hops in England commenced at a very early period, much earlier than the reign of Henry VIII., which is frequently assigned as the date of introduction. The most extensive plantations are in Kent; Sussex, Herefordshire, and other counties produce them in a less degree.—2. The fruit of the dog-rose; the hip.

A quadruped of the genus Equus (E. caballus), constituting with the ass, zebra, and quagga the family Equides or Solidungula. (For systematic characteristics see Equid.) Much doubt exists as to the native country of the horse, some referring it to Central Asia, some to North Africa, and some holding that it is indigenous in many regions. It is also matter of doubt whether it is now anywhere to be found in its native state, the wild horses of the steppes of Tartary and other regions of the Old World being possibly descendants of animals escaped from domestication, while those now living in South America are well known to have sprung from the cavalry introduced by the Spaniards. horses have been found associated with the mammoth and other extinct quadrupeds in the drift and in the bone-caverns of both the Old and New Worlds, twenty species having been described from North America alone, although no horses existed in America alone, although no horses existed in America, when it was discovered by Columbus. The horse varies much in form, size, and character with the climate and nature of the district it inhabits. It is now found in greatest perfection in England. Two breeds—namely, the large, powerful, black breed of Flanders, and the Arabian—have contributed more than all others to develop the present English working for the order of the present English working for the present form the present for the present f buted more than all others to develop the present English varieties from the original, comparatively light-limbed, wiry race found by Cæsar. The former laid the foundation of size, strength, and vigour for draught-horses and for those anciently used in war; while, when mailed armour was laid aside, and the horse began to be used for the chase, the latter conferred speed and endurance. The ladies' palfrey is largely derived from the Spanish genet, a small, beautiful, fleet variety of the Moorish barb. The hunter,

characterized by speed, strength, and endurance, represents the old English, Flanders, and Arabian breeds. The race-horse has less of Flemish and more of Arabian blood. Other leading varieties are the Suffolk Punch and Clydesdale, both chiefly of Flanders blood, and the best for draught and agriculture; and several varieties of ponies, as Galloway, New Forest, Shetland, &c. Carriage, riding, and other horses combine the above breeds in varying degrees, as speed, strength, size, &c., are required. Horses are said to have 'blood' or 'breeding' in proportion as they have a greater or less strain of Arab blood. The wild horse of Tartary is called a tarpan, that of North Africa a koomrah, and that of America a mustang, the last being descended from European parents imported.—2. The that of North Africa a koonvah, and that of America a mustang, the last being descended from European parents imported.—2. The male animal, in distinction from the female.

The mode of ascertaining a horse's power is to find what weight he can raise and to what height in a given time, the horse being supposed to pull horizontally. From a variety of experiments of this sort it is found that a horse at an average can raise 160 ths. a horse, at an average, can raise 160 lbs. weight at the velocity of $2\frac{1}{2}$ miles per hour. The power of a horse exerted in this way is The power of a horse exerted in this way is made the standard for estimating the power of a steam-engine. Thus we speak of an engine of 60 or 80 horse-power, each horse-power being estimated as equivalent to 33,000 lbs. raised one foot high per minute. Engineers differ widely in their estimate of the work a horse is able to execute. That given above is the estimate of Boulton and Watt based on the work of London dray-horses but it is considered much to be horses. Watt based on the work of London dray-horses, but it is considered nuch too high, 17,400 foot-pounds per minute being gene-rally considered nearer the truth. As it matters little, however, what standard be assumed, provided it be uniformly used, that of Watt has been generally adopted. The general rule for estimating the power of a steam-engine in terms of this unit is to mul-tiply together the wessive in panels on steam-engine in terms of this unit is to multiply together the pressure in pounds on a square inch of the piston, the area of the piston in inches, the length of the stroke in feet, and the number of strokes per minute, the result divided by 33,000 will give the horse-power, deducting one-tenth for friction. As a horse can exert its full force only for about the bound of the control of the con tion. As a horse can exert its full force only for about six hours a day, one horse-power of machinery is equal to that of 44 horses. —Nominal or calculated horse-power is a term still used, but of little real value, from its being calculated on steam at a pressure much below the real power exerted. Sometimes the real, actual, or indicated horse-power exceeds the nominal by as much as three to one. three to one

C. F. Fox.

4. Mental cultivation; liberal education; instruction in classical and polite literature,— 5. Classical and polite literature; a branch of such literature, as philology, grammar, rhetoric, poetry, the study of the ancient classics, and the like. In this sense generally used in the plural with the definite article prefixed—the humanities: but in Scotland used in the singular and applied to Letin and Letin literature classes. Latin and Latin literature alone; as, a professor of humanity.

fessor of humanity.
Philological studies, when philology was restricted to the cultivation of the languages, literature, history, and archaelogy of Graeu and Rome, were grey commonly called literac humaniores, or, in English, the humanities; and it is the conviction of their value as a moral and intellectual discipline which has led scholars almost universally to ascribe the origin of this appellation to a sense of their refining, clevating, and humanizing influence. This, however, I think is an erroneous etymology. They were called literac humaniores, the humanities, by way of opposition to the literac divines, or divinity, the two studies, philology and theology, then completing the circle of scholastic knowledge, which, at the period of the introduction of the phrase, scarcely included any branch of physical science.

Rybrid (hi'brid or hib'rid), n. [From L. hybrida, a hybrid; origin doubtful.] A mongrel or mule; an animal or plant, the produce of a female animal or plant, which has been impregnated by a male of a different variety, species, or genus. The most common hybrids are those which result from the connection of different varieties of the same species, as the produce of the horse and ass, of the wild boar and domestic sow; and, among vegetables, the endless modifications resulting from analogous impregnation from varieties of the rose and other connamental or useful plants. Hybrids have nation from varieties of the rose and other cornamental or useful plants. Hybrids have also been obtained, though less frequently, from different species of plants, insects, fishes, birds, and mammals. In the latter class the most common and useful hybrid is that produced between the horse and the ass, denominated par excellence 'the mule.' Some rare instances have occurred of hybrids resulting from the convention of migrals of resulting from the connection of animals of different genera. Hybrids are commonly sterile, or propagate only with an individual of pure breed.

Hydatid (hid'a-tid), n. [Gr. hydatis, from hydār, water.] In physiol. a term indefinitely applied to several distinct objects of a vesicular or cyst-like character, found in the bodies of men and certain animals. True hydatis, were formerly recorded as evetic new former than the control of the contr high riodies of their and certain animals. In the hydatids were formerly regarded as cystic entozoa, for example Cysticercus, Ccenurus, and Echinococus, but all these forms are now known to be larval stages of tapeworms. These hydatids may occur in almost any part of the body, and have been observed

in man, the ape, the ox, the sheep, the horse, the camel, the pig, the kangaroo, and some other vegetable-feeders. They are generally inclosed in an external sac, which is attached to the tissue of the organ in which it is situated. False hydatids are simple serous cysts, either occurring alone or in clusters, whose mode of origin is not distinctly understood. Such hydatids occur in the ovaries and uterus.

Hydnei (hid'nē-ī), n. pl. [From Gr. hydnēs, watery, moist, nourishing.] A nat. order of hymenomycetous fungi, distinguished by the hymenium being broken up into flat teeth, or variously flattened into spines, tubercles, granules, &c. Maunder.

Hydra (hidra), n. [L. hydra; Gr. hydra, from hydra, from hydro, water.] 1. In Greek myth. a serpent or monster in the lake or marsh of Lennea, in Argolis, represented as having many heads, one of which, being cut off, was immediately succeeded by another, unless the wound was cauterized. The destruction of this monster was one of the twelve labours of Hercules. See cut Hercules. Hence—2. Multifarious evil; evil or misfortune arising from many sources and not easily to be surmounted.

3. A southern constellation running along the south of Cancer, Leo, and Virgo.—4. A

genus of fresh-water polypes of a very low type of structure. There are various species, as H. wiridis, H. fusca, H. vulgaris. The body is in the form of a cylindrical tube, composed of two fundamental layers, the ectoderm and endoderm, the former containing in one variety green granules identical with the chlorophyll of plants. The base is disc-shaped, and by it the animal can attach itself to any body, being capable of shifting its position. The mouth is surrounded by a circle of extremely contractile tentacles, by which the animal obtains its food, and which are richly endowed with the urticating organs or thread cells so common in the order. The mouth opens immediately into the stomach, and there are no internal organs of any kind, nor anal orifice. The Hydra may be divided into almost any number of fragments, and each portion becomes developed into a fresh independent polypite. Reproduction is effected by genmation as well as by the production of ova and serem-cells.

Hydragogue (hī'dra-gog), n. [Gr. hydra-gōgvs—hydōr, water, and agōgē, a leading or drawing, from agō, to lead or drive.] In med. (a) an active purgative, as jalap, which produces a great flux from the intestinal membrane, and which consequently gives rise to very watery stools. (b) A remedy believed to be capable of drawing off serum effused into any part of the body.

Hydra-headed (hī'dra-head-d), a. [From the fabulous Hydra, slain by Hercules.] Lit. having many heads, each of which is renewed as it is cut off; hence, as applied to abuses, nuisances, vices, and the like, incapable or very difficult of extipation, by reason of having numerous sources, and a tendency to spring up again after temporary repression; multiform and tending constantly to recur.

Hydrangea (hī-dran'jē-a), n. [Gr. hydōr, water, and angeton, a vessei.] A genus of shrubs or herbs of the nat. order Saxifragacee, containing about thirty-three species, notives of Asia and America. The garden

made of the well-known principle in hydrostatics, namely, that a pressure exerted on any part of the surface of a liquid is transmitted undiminished to every part of the liquid and in all directions. By this apparatus great power is obtained for compressing objects, or drawing or litting great weights. The press is usually constructed as shown in the accompanying figure. By means of a small forcing pump (the handle of which is shown at a in first figure, the piston at a in second) water is injected into a strong cast-iron cylinder B, into which is fitted the piston or ram c. The pressure transmitted by the water, acting upon the solid piston c, slowly and powerfully urges upwards the table D, until the requisite pressure is produced upon the materials placed between the upper and lower tables. placed between the upper and lower tables of the press. Hydrocharidaceæ, Hydrocharidææ (hidro-ka'rid-a''sē-ē, hi'drō-ka-rid''ē-ē), n. pl. [Gr. hyddr, water, and charis, grace.] A nat. order of monocotyledonous floating and nat. order of monocotyledonous floating and creeping plants, inhabiting ditches, rivers, and lakes in various parts of the world. Some of the species are dioccious. Vallisseria spiralis, a member of the order, is a favourite object of microscopic examination, the circulation or rotation of the cell-contents being well seen in the leaves. The genus Anacharis, so great a pest in canals, also belongs to it, as do the genera Hydrocharis, and Stratiotes or water-soldiers. Hydrocharis (hi-dro'ka-ris), n. A genus of plants, including the frogbit (H. morsus range). See FROGBIT.
Hydrochlorate (hi-dro-klōr'āt), n. A salt

plants, including the Prophit (H. morsus rance). See Frogers.

Hydrochlorate (hi-drō-klōr'āt), n. A salt of hydrochloric acid.

Hydrochloric (hi-drō-klōr'āt), n. In chem. pertaining to, or compounded of, chlorine and hydrogen gas, shydrochloric acid. —Hydrochloric acid (HCI) is a gaseous compound of hydrogen and chlorine. It is colourless, has a pungent odour and an acid taste. It is quite irrespirable, extinguishes fame, and dissolves very readily in water. A concentrated aqueous solution of hydrochloric acid has been long known under the names of spirit of salt and muriatic acid.

Hydrochcerus (hi-drō-ke'rus), n. [Gr. hydōr, water, and choiros, a pig.] A genus of rodent mammals of the family Cavidae, the best-known member of which is H. Capybara, the capybara or water-hog. See

Capybara, the capybara or water-hog. See

CAPYBARA.

Hydrocorisæ (hi-drō-kor'i-sē), n. pl. [Gr. hydōr, water, and koris, a bug.] The waterbugs, a tribe of heteropterous insects which live almost entirely in water and feed on other aquatic insects. It contains two families, the Notonectidæ or water-boatmen, and the Nepidæ or water-scorpions.

Hydrocotyle (hi-drō-ko'ti-lē), n. pl. [Gr. hydōr, water, and cotylē, a cavity, in reference to the plants growing in moist situations, and the leaves being hollowed like cups.] A genus of plants of the nat. order Umbelliferæ. H. vulgaris (common pennyworb) is a common British plant, growing in boggy

crac. A. vacquers (common pennyword) is a common British plant, growing in boggy places and on the edges of lakes and rivulets. It has round peltate leaves, and small simple umbels of pale pink flowers. About 70 species are known, one of which (H. asiatica) is employed in India as an alterative toxic.

species are known, one of which (H. asia-tica) is employed in India as an alterative tonic.

Hydrocyanize (hi-drō-sī'an-āt), n. In chem. a salt of hydrocyanic acid.

Hydrocyanic (hi'drō-sī'an-īt), n. [From the hydrocyanic (hi'drō-sī-an'īk), a. [From the hydro-of hydrogen, and the eyan-of cyanogen.] In chem. pertaining to or derived from the combination of hydrogen and cyanogen; as, hydrocyanic acid.—Hydrocyanic acid. (HCN), a colouriess liquid which solidifies at 5° F. to feathery crystals, and boils at 80°. Its specific gravity is about 0·7. It dissolves in all proportions in water, forming a liquid which reddens litmus paper but slightly. It is found in laurel leaves and in many stone fruits, and gives to bitter almonds their peculiar flavour. Hydrocyanic acid is frequently used medicinally as a powerful sedative and anti-irritant, especially to allay cough in phthisis, and to mitigate the spasmodic action of whooping-cough. It requires to be employed with much caution, as it is one of the strongest poisons known. Called also Prussic Acid.
Hydrocyst (hi'drō-sist), n. [Gr. hydra, a water-serpent, and hystis, a bladder, a cyst.] In zool. a process, a sort of feeler, attached to the cemosarc of the Physophorida, an order of oceanic Hydrozoa.

Hydrodictyeæ(hi-drō-dik-ti'ē-ē), n. pl. [Gr. hydra, water, and diktyon, a net.] An order of green-spored algæ, the members of which are remarkable for the beauty and peculiarity and rapidity of their growth. Their mode of development, which is by the continuous resolution of the endochrome into zoospores, is without example in other orders. They have their name from the fact

that, when full-grown, they resemble a purse composed of a net-work of threads. Hydrodynamic, Hydrodynamical.0ir'drodi-nam'ik, hi'dro-di-nam'ik-al), a. [Gr. hydor, water, and dynamis, power, force.] Pertaining to or derived from the force or pressure of water.
Hydrodynamics (hi'drō-di-nam''iks), n. That branch of the science of mechanics which treats of the effects of the application of forces to fluids; or. in a narrower sense.

of forces to fluids; or, in a narrower sense, that part of the science which treats of the application of forces so as to produce motion in fluids (otherwise called hydrokinetics), in contradistinction to hydrostatics, which is concerned with forces applied to fluids at

rest.

Hydræcium (hi-drē'si-um), n. [Gr. hydra, a water-serpent, and oikos, a house.] In zool. the chamber into which the cœnosarc in many of the order of oceanic Hydrozoa named Calycophoridæ can be retracted.

Hydro-electric (hi'drō-ē-lek''trik), a. [Gr. hydōr, water, and E. electric.] Pertaining to or produced by the evolution of electricity by a battery in which water or steam is employed.—Hydro-electric machine, a machine for generating electricity by the escape of steam under high pressure from a series

Armstrong's Hydro-electric Machine.

of jets connected with a strong boiler, in which the steam is produced. The jets of steam (which have to pass through a cooling box) are electrified by the friction. Positive electricity is thus collected by directing the steam upon a metal comb communicating with an insulated conductor.

Hydro-extractor (hi'drō-eks-trakt''er), n. A machine for expelling water from textile fabrics by the action of centringal force.

Hydrofluoric (hi'drō-fili-or'lik), a. (Gr. hydrō-water, and E. fluor.) Consisting of fluorin and hydrogen.—Hydrofluoric acid (H F), an acid obtained by distilling a mixture of one part of the purest fluor spar in flue powder with two of sulphuric acid. It has a very strong affinity for water, acts energetically on glass, and is of all substances the most destructive to animal matter.

Hydrofluorisiticate (hi-drō-fili-ō-sil'i-kāt), n.

on glass, and is of all substances the most destructive to animal matter.

Hydrofinosilicate (hi-drō-fiū-ō-sil'i-kāt), n. [Gr. hydōr, water, and E. fluosilicate (which see).] In chem a salt formed by the union of hydrofinosilicic acid with a base.

Hydrofinosilicic (hi-drō-fiū-ō-sil-isik), a. In chem. the term applied to a compound acid consisting of one atom of hydrofinoric and two of fluosilicic acid.

Hydro-galvanic (hi'drō-gal-van'ik), a. Pertaining to, consisting of, or produced by electricity evolved by the action or use of fluids; as, a hydro-galvanic current.

Hydrogen (hi'drō-jen), n. [Gr. hydōr, water, and gennad, to generate.] An important elementary substance, for a long time only known in a separate state in the gaseous or permanently clastic form, but now shown to be the vapour of a metal, and itself capable of solidification. Hydrogen was first correctly described by Cavendish in 1766, under the name of inflammable air, and it was by some called phlogiston, from the notion that it is the matter of heat.

The name hydrogen was given to it by the Franch chariets in consequence of its being the notion that it is the matter of heat. The name hydrogen was given to it by the French chemists in consequence of its being one of the elements of water. It also forms a component of all vegetable and animal products, and is, therefore, abundantly diffused throughout nature. It is usually procured by the action of dilute sulphuric acid upon zine or iron, or by passing the vapour

of water over red-hot iron. Pure hydrogen is a colourless, tasteless, and inodorous gas; it is a powerful refractor of light; the least dense of all the gases, and hence the most rapidly diffusible, and the lightest body in nature. In consequence of its extreme lightness it is the recognized standard of unity in referring to the atomic weight of bodies or their combining proportions in regard to weight, and it has been assumed also as the unit in speaking of the specific gravity of gases, although common air is the more generally received standard. It is neither acid nor alkaline; it cannot support respiration, although tip proves fatal to life more generally received standard. It is neither acid nor alkaline; it cannot support respiration, although it proves fatal to life from deprivation of oxygen, rather than from any inherent noxious quality. When in contact with air it is inflammable in an eminent degree, and burns with a pale blue flame; but it does not support combustion. Two volumes of hydrogen with six of air form an explosive mixture, and when two volumes of hydrogen are mixed with one of oxygen and inflamed, the explosion is extremely violent. The flame of hydrogen is sometimes employed for exciting intense heat; but the most intense heat that can be produced is caused by the burning of hydrogen in oxygen gas, and this principle has been applied to increase the temperature of blast-furnaces in iron-works, by making the gases pass separately through heated tubes to the furnace. Water is the sole product of the combustion of hydrogen gas; and when two volumes of pure hydrogen gas are mixed with one volume of pure oxygen gas, and the mixture inflamed in a proper manner by the electric spark, the gases totally disancer, and the interview of the vessel is of the combustion of hydrogen gas; and when two volumes of pure hydrogen gas are mixed with one volume of pure oxygen gas, and the mixture inflamed in a proper manner by the electric spark, the gases totally disappear, and the interior of the vessel is covered with drops of pure water, equal in weight to the two gases. Again, if pure water be exposed to the action of voltaic electricity it is resolved into two volumes of hydrogen and one of oxygen; so that water is proved both by synthesis and analysis to consist of two volumes of hydrogen combined with one of oxygen, or of two parts by weight of hydrogen with sixteen of oxygen, so that the number 16 becomes the atomic weight of oxygen, and 18 the weight of a molecule of water. Hydrogen is sparingly soluble in water, nor is there any other liquid which is capable of dissolving it in great quantity. It unites with all other liquid which is capable of dissolving it in great quantity. It unites with all other liquid which for one only of great curiosity, but of vast importance and utility: thus with oxygen it forms water; with nitrogen, ammonia; with chlorine, hydrochloric acid, with fluorine, hydrofluoric acid, &c. It forms compounds also with carbon, iodine, phosphorus, cyanogen, sulphur, &c.

Rydroguret† (in: drog'ūr-et), n. A compound of hydrogen with a base.

Hydrogurettedt (hī-drog'ū-ret-ted), a. In chem. a term applied to a compound of hydrogen with a base. Hydroid (hī'droid), a. [Gr. hydra, a water-serpent, and eidos, likeness.] Related to or resembling the polyp-like hydra. 'Floating colonies of hydroid polypes.' Carpenter. Hydroida (hī-droid'a), n. pl. [See Hydroid. A sub-class of the Hydrozoa, comprising the animals most nearly allied to the Hydra. It includes the orders Hydria. Gorynida, and Sertularida. The last order is sometimes divided into two, Sertularida and Campanullarida.

Hydrokinetics (hī'drō-kin-et"iks), n. Same

Hydrokinetics (hī'drō-kin-et"iks), n. Same as Hydrodynamics (which see). Hydrolite (hī'drō-lit), n. [Gr. hydōr, water, and lithos, a stone.] A name of the zeolitic mineral gmelinite, given because of the water it contains.

Hydrological (hī-drō-lof'ik-al), a. Pertaining to hydrology.

Hydrology (hī-drol'o-jist), n. One skilled in hydrology (hī-drol'o-ji), n. [Gr. hydōr, water, and logos, discourse.] The science that treats of water, its properties, phenomena, and laws, its distribution over the earth's surface, &c.

Hydronacy (hī'drō-man-si), n. [Gr. hydōr, water, and manteia, divination.] A method of divination or prediction of events by water.

Hydromantic (hī-drō-man'tik), a. Pertain-

Hydromantic (neuro-matrix), u. Pertaming to divination by water.

Hydromel (hi'drō-mel), u. [Fr., from Gr. hydro, water, and meli, honey.] A liquor consisting of honey diluted in water; when allowed to ferment it is called mead or interest before the second of the sec

consisting of noney direct in water; when allowed to ferment it is called mead or vinous hydromel.

Hydrometallurgy (hī-drō-met'al-ér-ji), n. [Gr. hydōr, water, and E. metallurgy (which see).] The process of assaying or reducing ores by liquid reagents.

Hydrometeor (hī-drō-mē'tē-ér), n. [Gr. hydōr, water, and meteora, meteors. See METEORS.] A meteor or atmospheric phenomenon dependent upon the vapour of water; in the plural, a general term for all the aqueous phenomena of the atmosphere, as rain, hail, snow, &c.

Hydrometeorological (hī-drō-mē'tē-ér-ōloj' ka.al), a. Relating or pertaining to hydrometeorology.

Hydrometeorology (hī-drō-mē'tē-ér-ol"o-ji), n. The branch of meteorology which concerns itself with water in the atmosphere in the form of rain, clouds, snow, hail, &c.

in the form of rain, clouds, snow, hall, &c.

Hydrometer (hi-drom'et-er), n. [See HyDROMETRY.] 1. An instrument to measure
the specific gravity or density of water and
other fluids, and hence the strength of spiritnous blumors and of various solutions. Hyother fluids, and hence the strength of spirituous liquors and of various solutions. Hydrometers are variously constructed. A very common type consists of a graduated stem of uniform diameter and cross-section, a bulb to cause it to float in the fluid, and a weight or counterpoise to cause the stem to stand unright as it.

it to float in the fluid, and a weight or counterpoise to cause the stem to stand apright as it floats. On being placed in a liquid it sinks until a certain point on the scale is on a level with the surface of the liquid, and from the reading of the scale at that point the specific gravity of the liquid is ascertained either directly or by a simple calculation.—2. An instrument used for measuring Hydrometer, as in rivers, from reservoirs, &c. Hydrometra (Ni-drō-metra), n. The typical genus of the hemitperous family of insects Hydrometride (which see). Hydrometride (which see). Hydrometride observations.—Hydrometric observations.—Hydrometric observations.—Hydrometric observations.—Hydrometric pendulum, an instrument consisting of a hollow hall suspended from the centre of a graduated quadrant, and held in a stream to mark by its deflection the velocity of the current. to mark by its deflection the velocity of the

enrient.

Hydrometridæ (hi-drō-met'ri-dē), n. pl. A

family of hemipterous insects, consisting of
species found upon the surface of water,
upon which they possess the power of locomotion. The genus Hydrometra, which gives the name to the family, creeps upon the water with the body somewhat elevated. In these insects the legs are very long, and

adapted for walking on the water, and some of the species may be met with on almost every pond or stream.

Hydrometrograph (hī-drō-metrō-graf), n. [Gr. hydōr, water, metron, measure, and graphō, to describe.] An instrument for determining and recording the quantity of water discharged from a pipe, an orifice, &c., in a given time. in a given time.

in a given time.

Hydrometry (hī-drom'ei-rī), n. [Gr. hydōr, water, and metron, measure.] The art or operation of determining by means of hydrometers the specific gravity, density, velocity, force, &c., of fluids.

Hydromys (hī'drō-mis), n. [Gr. hydōr, water, and mys, a mouse.] A genus of rodent quadrupeds, family Muridæ; the beaver-rats. See BEAVER-RAT.

Hydropathic, Hydropathical (hī-drō-path'ik, hī-drō-path'ik al), a. Relating to hydropathy.

Hydropathish (hī-dro'ba-thish), u. 1. One

hydropathist (hī-dro'pa-thist), n. 1. One versed in or who practises hydropathy.—2. One who believes in the efficacy of hydropathic treatment.

He has tried both hydropathy and homosopathy, . . has now settled into a confirmed hydropathist.
Sala.

Hydropathy (hī-dro'pa-thi), n. [Gr. hydlör, water, and pathos, affection.] A mode of treating diseases by the copious and frequent use of pure water both internally and externally; the water-cure. This system is said to increase the cutaneous exhalation to a very large amount, and thus to draw off speedily from the blood certain deleterious matters.

rious matters.

Hydrophane (hi'drō-fān), n. [Gr. hydōr, water, and phatnō, to show.] In mineral. a variety of opal, made transparent by immersion in water.

Hydrophanous (hi-drofan-us), a. Made transparent by immersion in water.

Hydrophiad (hi'drō-fād), n. [Gr. hydōr, water, and ophis, a snake.] A snake belonging to the section known as water-snakes. See Hydbloff.

HYDRIDÆ.

Hydrophis (hi'drō-fis), n. [Gr. hydor, water, and ophis, a serpent.] Water-snakes, a genus of venomous reptiles, of the family

genus or venomous repents, of the running Hydridae, very common in certain parts of the Indian seas. They feed on fishes. Hydrophobia (bi-drō-fo'bi-a). n. IGr. hydror, water, and phobeomai, to fear.] 1. A morbid unnatural dread of water.—2. A disease produced by the bite of a mad animal, especially of a mad or rabid dog, one of the characteristics of which is an aversion to or inchilities of which is an aversion to or inchilities. or a mad or rapid dog, one of the characteristics of which is an aversion to or inability to swallow liquids. The term is more especially applied to the disease in man, rables being considered preferable as the name of the disease which constitutes madness in animals. It seems doubtful whether hydrophobia is curable, though numerous cures are said to have been effected by M. Pasteur's system of incoulation teur's system of inoculation.

Hydrophobic (hī-drō-fob'ik), a. Of or per-

taining to hydrophobia.

Hydrophoby (hi'drō-fōb-i), n. Hydrophobia (which see).

Hydrophora (hī-drof'o-ra), n. pl. [Hydra, a genus of polypes, and Gr. phero, to carry, to bear. I One of the three divisions into which Huxley and other authors divide the Hydro-Huxley and other authors divide the Hydrozoa, the other two being the Discophora and the Siphonophora. The members are, in all cases except that of Hydra, fixed ramified hydrosomes, on which many hydranths and gonophores are developed. The tentacula are either scattered over the hydranths or arranged in one circle round the mouth, or in two circles, one close to the mouth and one near the aboral end. Very generally—for example, in all Sertularidæ and Tubularidæ—there is a hard chitinous, cuticular skeleton or comosarc-which usually generally—for example, in all settiliarias and Tubularidae—there is a hard chitinous, cuticular skeleton or comosarc, which usually gives rise to hydrothece, into which the hydranths can be retracted. The gonophores present every variety, from sacs to free-swimming medusoids. The inner margin of the bell in these medusoids is always produced into a velum, and otolithic sacs and eye-spots are very generally disposed at regular intervals around the circumference of the bell. The great majority of what are sometimes termed the naked-eyed medusa (Gymnophthalmata) are simply the free-swimming gonophores of Hydrophora. Hydrophore (hi'drō-för), n. [Gr. hydör, water, and phoros, bearing, from pherö, to bear.] An instrument for obtaining specimens of the water of a river, a lake, or the ocean, at any particular depth.

Hydrophthalmia, Hydrophthalmy (hi-

drof - thal'mi-a, hī - drof-thal'mi), n. hydor, water, and ophthalmos, the eye. I med. an affection of the eye, caused, at times, by an increase in the quantity of the

times, by an increase in the quantity of the aqueous, at others, of the vitreous humour. Dunylkson, at the vitreous humour. Bydrophyllium (hi-drō-fil'li-um), n. pl. Hydrophyllia (hi-drō-fil'li-u), [Gr. hydra, a water-serpent, and phyllon, a leaf.] In zool, an overlapping appendage or plate which protects the polypites in some of the oceanic Hydrozon, as Calycophoridæ and Physophoridæ. It is often termed a Braet. Hydrophyte (hi'drō-fit), n. [Gr. hydōr, water, and phylon, a plant.] A plant which lives and grows in water. Hydrophytology (hi'drō-fit-ol'o-ji), n. [E. hydrophyte (which see), and Gr. logos, discourse.] That branch of botany which relates to water-plants.

course.] That branch of botany which relates to water-plants.

Hydropic, Hydropical (hi-drop'ik, hi-drop'ik.al), a. [L. hydropicus, Gr. hydropikos, from hydrops, dropsy—hydro, water, and ops, the countenance, face.] Containing or produced by water; dropsical; of or pertaining to dropsy; resembling dropsy in character.

Every last is a kind of hydropic distemper, and the more we drink the more we shall thirst.

Tillotson.

Hydropic (hi-drop'ik), n. In med. a medicine that relieves or cures dropsy.

hydropleally (ni-drophi-ai-n), a.a. in a hydropleal manner.

Hydropneumatic (hi'drō-nū-mat'ik), a. [Gr. hydōr, water, and pneumatitos, infinted, from pneuma, breath, spirit.] Of or pertaining to, or produced by, the action of water and air; involving the combined action of water and air; involving the combined action of water and air.

and air; involving the combined action of water and air or gas.

Hydropsy (hi'drop-si), n. [Gr. hydör, water, and ôps, aspect or appearance.] Dropsy.

Hydropult (hi'drop-si), n. [Gr. hydör, water, and term. pult, as in catapult (which see).] A machine for throwing water by hand-power, used as a garden-engine or fire-annihilator, and applicable to all the purposes for which a breferent of force hard. purposes for which a hydrant or force-pump is required.

is required.

Hydropyretic (hi'drō-pi-ret"ik), a. [Gr. hydör, water, and pyretos, fever.] In med. of or pertaining to sweating fever.

Hydrorhiza, (hi-drō-riza), n. [Gr. hydra, a water-serpent, and rhiza, a root.] In zool.

the adherent base or proximal extremity of any hydrozoon.

Hydro-sarcocele (hī-drō-sār'kō-sēl), n. [dr. hydōr, water, and E. sarcocele. Sarcocele attended with dropsy of the tunica vagi-

erie attenued with dropsy of the tanticar agrinalis.

Hydroscope (hi'drō-skōp), n. [Gr. hydōr, water, and skopeō, to view.] 1. An instrument intended to mark the presence of water in the air.—2. A kind of water-clock or instrument used anciently for measuring time, consisting of a cylindrical graduated tube, from which water slowly escaped by an aperture at the bottom, the subsidence of the water marking the lapse of time.

Hydroselenate (hī-drō-se-len-āt), n. In chem. a salt formed by the union of hydroselenical with a salifiable base.

Hydroselenic (hī-drō-se-len'īk), a. Of or pertaining to a combination of hydrogen and selenium.—Hydroselenic acid (H₂Se), a colourless gas which resembles but is more offensive than sulphuretted hydrogen.

colouriess gas which resembles but is more offensive than sulphuretted hydrogen.

Hydrosome (hi'drō-sōm), n. [Gr. hydra, a water-serpent, and sōma, body.] In zool. the entire organism of any hydrozoon.

Hydrostat (hi'drō-stat), n. A term applied to any apparatus for preventing the explosion of steam-boilers.

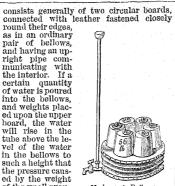

to any apparatus for preventing the explosion of steam-boliers.

Hydrostatic, Hydrostatical (hi-dro-static, hi-dro-static, a. Gr. hydro, water, and statikos, static, standing or settling.] Relating to hydrostatics; pertaining to or in accordance with the principles of the equilibrium of fluids.

Hydrostatic balance, a balance used for determining very accurately the specific gravity of bodies by weighing them in water.

Hydrostatic bellows, an apparatus contrived to illustrate the law of the distribution of pressure through liquids; viz. that when any portion of the surface of a confined liquid is pressed by any force every other portion of the surface of the confining vessel, equal in area to the first portion, is pressed by an equal force; it shows how a great upward pressure may be produced, as in the hydraulic press, and also that the pressure of a fluid upon the bottom of a vessel does not depend upon the quantity of the fluid but upon its altitude.

certain quantity of water is poured into the bellows, and weights plac-ed upon the upper board, the water will rise in the tube above the level of the water in the bellows to such a height that the pressure caus-ed by the weight of the small quan tity of water in the

Hydrostatician (hi'drō-stat-i'shan), n. One
versed in hydrostatics. [Rare.]
Hydrostatics (hi-drō-stat-iks), n. The
science which treats of the weight, motion,
and equilibrium of fluids, particularly of
water; or, in a narrower sense, that branch
of the science of hydrodynamics which treats
of the properties of fluids at rest. It takes
into consideration the pressure and equilibrium of non-elastic fluids, the method of
determining the specific gravities of subbrium of non-elastic fluids, the method of determining the specific gravities of substances both solid and liquid, the equilibrium of floating bodies, and the phenomena of capillary attraction.

Hydrosulphate† (hi-drō-sulfāt), n. The same as Hydrosulphuvet.

Hydrosulphite† (hi-drō-sulfāt), n. A saline compound of hydrosulphurous acid and a hose

Uses.

Hydrosulphuret † (hi-drō-sul'fū-ret), n.

[From hydrogen and sulphuret.] In chem. a combination of sulphuretted hydrogen with an earth, alkali, or metallic oxide.

Hydrosulphuretted † (hi-drō-sul'fū-ret-ed), a. Combined with sulphuretted hydrogen.

a. Combined with sulphuretted hydrogen. Hydrosulphuric (hi'drò-sul-fù'rik), a. In chem. pertaining to, derived from, or containing hydrogen and sulphur; as, hydrosulphuric acid.
Hydroteilurate (hi-drō-tel'lū-rāt), n. In chem. a salt formed by the combination of an acid composed of hydrogen and tellurium with a salifiable base.
Hydroteiluric (hi'drō-tel-lū'rik), a. Of or pertaining to, or obtained from hydrogen and tellurium.
Hydrotheca (hi'drō-thē-ka), n. [Gr. hydra, a water-serpent, and thātā, a case.] In zool.

a water-serpent, and thete, a case.] In zoot. a little chitinous cup, in which each polypite of the Sertularida and Campanularida protected.

is protected. Hydrothermal (hi-drō-thermal), a. [Gr. hydōr, water, and thermos, hot.] Of or relating to heated water, specifically, applied to the action of heated waters in producing geological changes by dissolving mineral substances and re-depositing them when gooled.

Hydrothorax (hī-drō-thō'raks), n. [Gr. hy-dōr, water, and thōrax, a breastplate, the part covered by the breastplate, the chest.]

In med. dropsy in the chest.

Hydrotic, Hydrotical (hi-drot'ik, hi-drot'ik-al), a. [Fr. hydrotique, from Gr. hydör, water.] Causing a discharge of water or

Hydrotic (hi-drot/ik), n. A medicine that purges off water or phlegm.

Hydrous (hi/drus), a. Containing water;

Hydroxanthate † (hi-droks-an'that), n [Gr. hydör, water, and xanthos, yellow.] In chem, a compound of hydroxanthic acid with a base.

Hydroxide, Hydroxyde (hī-droks'id), n. [Gr. hydōr, water, and E. oxide.] In chem. a metallic oxide combined with water; a metallic hydroxyde. tallic hydrate

Hydrozoon (hī-drō-zō'on), n. pl. Hydrozoa (hī-drō-zō'a). [Gr. hydra, a water-serpent, and zōon, a living creature.] In zool. one of a class of radiated animals, forming, with the Actinozoa, the sub-kingdom Cœienterata. The Hydrozoa are divided into four sub-classes—Hydroida, Siphonophora, Discophora, and Lucernarida. The genus Hydra may be taken as the type. See Hydra. Hydruret† (hī'drur-et), n. In chem. a compound of hydrogen with metals, &c. Hydrus (hī'drus), n. [Gr. hydōr, water.] 1. A genus of water-snakes, now generally called Hydrophis, the type of the family Hydridæ (which see).—2. A constellation of the southern hemisphere. Hyemal (hī-em'al), a. [L. hiems, winter.] Belonging to winter; done in winter. Hyemate† (hī'em-āt), r. i. [L. hiemo, hiematum, to pass the winter, from hiems. winter.] To pass the winter.

ter.] To pass the winter.

Hyemation (hi-em-à'shon), a. [L. hiematio, hiemationis, a passing the winter, from hiemo.] 1. The passing or spending of a winter in a particular place.—2,† The act of affording shelter during winter.

Hyems (hi'emc), n. [L. hyems, hiems, winter.] Winter. Shak.

ent districts.

Hyetograph (hi'e-to-graf), n. A chart showing the average rainfall in the different regions of the earth.

Hyetographic, Hyetographical (hi'et-o-graf''ik-al), a. Pertaining to hyetography. (b) et octor files, light hyetography.

hyetography (hi-et-og'ra-fi), n. [Gr. hyetos, rain, and graphe, description.] The science of the distribution of rain; a knowledge of the quantities of rain which fall in different localities in a given time.

Hyetometer (hi-et-om'et-èr), n. [Gr. hyetos, rain, and metron, a measure.] A rain-gauge.

Hygeia (hi-je'ya), n. [Gr. hygies, sound,

healthy.] 1. In class. myth. the goddess of health, daughter of Esculapius. She is re-presented as a blooming maid with a bowl in one hand and

in one hand and grasping a serpent with the other.— 2. One of the small planets or asterolds between the oids between the orbits of Mars and Jupiter, discover-ed in 1849. It revolves round the sun in 2160 solar days, and is three and one fourth times the distance of the earth from the sun. the sun.

Hygienst (h'jē-ist), n. One versed in hygiene.

Hygiean (hi-jē'yan), n. Same as Hygeian.

Hygieist (h'jē-ist), n. One versed in hygiene.

Hygienal (hi-ji-ist), n. One versed in hygiene or the science of health.

Hygienal (hi-ji-n'al), a. Relating to hygiene or the preservation of health.

Hygiene (hi'ji-ën), n. [Fr. Hygiène, from Gr. hygiènes, healthy.] That department of medicine which treats of the preservation of health, and discovers proper means for the continuance of that state; a system of principles or rules designed for the promotion of health, especially the health of households or communities; sanitary science.

Hygienic (hī-ji-en'ik), a. Relating to hygiene; pertaining to health, especially the health of communities.

How small a proportion of them die before the age of maturity, in the present state of hygienic knowledge.

F. S. Mill.

Hygienically (hī-ji-en'ik-al-li), adv. In a hygienic manner; in a manner fitted to preserve health.

Hygroblepharic (hi-grō-blefa-rik), a. [Gr. hygros, moist, and blepharon, the eyelid.] In anat. a term applied to the excretory ducts of the lachrymal glands, and their orifices.

Hygrograph (hi'grō-graf), n. [Gr. hygros, moist, and graphō, to write.] An instrument which registers automatically the variations of the atmosphere as regards moistness.

Hygrology (hī-grol'o-ji), n. [Gr. hygros, moist, and logos, a discourse.] In med. the doctrine of the humours or fluids of the

Hygrometer (hi-grom'et-ër), n. [Gr. hygros, moist, and metron, measure.] An instrument for measuring the degree of moisture of the atmosphere. The chief classes of hygrometers depend either upon absorption or upon condensation. Of the former kind is the hygrometer of Saussure, in which a hair, which expands and contracts in length according as the air is more or less moist, is made to move an index. Of the latter sort is Daniell's hygrometer, which consists of a bent glass tube terminating in two bulbs, the one covered with muslin, the other of black glass, and containing ether and a thermometer. Ether being poured on the muslin, the black bulb, cooled by the evaporation of the ether within, is soon covered with dew, at which moment the re-ending of the inclosed thermometer, compared with another in the air, gives the dew-Hygrometer (hi-grom'et-er), n. Hygrometric, Hygrometrical (hī-grō-metrik, hī-grō-metrik-al), a. 1. Pertaining to hygrometry; made by or according to the hygrometer.—2. Readily absorbing and retaining moisture; as, hygrometric substances. Hygrometry (hi-grom'et-ri), n. That branch of physics which relates to the determination of the humidity of bodies, especially of

the moisture in the atmosphere, embracing also the theory and use of such instruments as have been invented for this purpose.

Hygrophanous (lū-grof'an-us), a. [Gr. hygros, moist, and phainō, to show.] In bot. transparent or watery-like when moist, and opaque when dry.

Hygroscope (lū'grō-skōp), n. [Gr. hygros, moist, and skopeō, to view.] An instrument for indicating the presence of moisture in the atmosphere, without measuring the amount. Sometimes also used for Hygrometer.

meter.

Hygroscopic, Hygroscopical(hī-grō-skop'-lik, hi-grō-skop'ik-al), a. 1. Pertaining to the hygroscope; perceptible or capable of being detected only by the hygroscope; as, a film of hygroscopic moisture covered the glass.—2. Having the property of imbibing moisture from the atmosphere or of becoming coated with a film of moisture.

Hygroscopicity (hi'grō-skō-jis-'i-ti), n. In bot. the property possessed by vegetable tissues of absorbing or discharging moisture, and extending or shrinking accordingly.

Hygrostatics (hi grō-stat'iks), n. (für hygros, moist, and statikë (epistëmë, knowledge understood), statics, from histëmi, to stand.]

I.

I is the ninth letter, and the third vowel of the English alphabet, in which it represents not only several vowel sounds but also the consonantial sound of y. The two principal sounds represented by it in English are the short sound as in pit, pin, fin, and the long as in pine, fine, wine, the latter being really a diphthongal sound. It has also three other sounds, viz that heard in first, dirk (é, the neutral vowel); that heard in machine, intrigue (which, however, can scarcely be considered a modern English sound); and the consonant sound heard in many words when it precedes a vowel, as in million, opinion, trunnion. The short sound of i (as in pin), or one closely allied to it, is one of the oldest vowel sounds belonging to the Indo-European languages, the three original vowels of the primitive Indo-European speech. In the Tentonic languages, however, is found only in comparatively few roots corresponding to an original it, among which we may mention wit, wiss (to know) = Goth. witan, G. wissen, L. videre, Gr. idein, Skr. vid; E. bitter = L. fid (findo), Skr. bhid, to split. More commonly it takes the place of an original a, as in sit, from a root said (L. sedere); E. is, Skr. asti; E. birm, Skr. bhram (to whirl); E. middle, Skr. madhya, &c. The diphthongal sound of i, as an English sound, is comparatively modern, being developed from an older i (sounded as ee in seem) by the prefixing of an a sound. The same change has taken place in German and Dutch, but in these languages the new sound is represented by ei and if respectively. This letter enters into several digraphs, as in full, field, seize, feign, friend; and with o, as in oil, join, coin, it forms a proper diphthong. No genuine English word ends with i, this sound when occurring at the end of a word being expressed by y; it is written however in foreign words beginning with these letters were classed together till comparatively recent times.

Ice (is), n. [A. Sax. 1s, 2ss; comp. D. ijs, Dan.
and Sw. 1s, Icel. 1ss, G. ets, O.G. 1s; referred
along with iron, G. etsen, to a lost verb
eisan, to shine or glance.] I. Water or other
fluid congealed or in a solid state; a solid,
transparent, brittle substance, formed by
the congelation of a fluid by means of the
abstraction of the heat necessary to preserve its fluidity. Water begins to freeze at
32° of Fahrenheit, and in freezing expands
very rapidly and with great force. In consequence of this expansion the ice becomes
lighter than water, and floats on its surface.
Its specific gravity is nearly 0.92, so that the
volume of ice is to that of water as 1 to
0.92, consequently water expands by about
one-eleventh of its bulk in passing into ice.
During the formation of ice the particles arrange themselves into ranks and lines which
cross each other at angles of 60° and 120°, range themselves into ranks and lines which cross each other at angles of 60° and 120°, as may be seen by examining the surface of water while freezing in a saucer. Artificial ice may be produced by the alternate condensation and expansion of common air. When air is compressed its heat is squeezed out of it, and when it is again allowed to expand it absorbs heat from the surrounding medium, and hence causes that medium to fall considerably in temperature. Ice is also produced by exposing water to the ac-

tion of substances that produce quick eva-poration, such as ether and sulphuric acid. The process will be greatly accelerated if made to take place under the exhausted remade to take place under the exhausted receiver of an air-pump. On this principle ice is formed artificially in the hottest countries. The temperature of freezing is lowered 0075° C. for every atmosphere of pressure, so that the freezing and boiling points are both variable. —2. Concreted sugar.—3. Cream or milk sweetened, variously flavoured, and frozen; ice-cream.—To break the ice, is to make the first opening to any attempt; to remove the first obstructions or difficulties; to open the way. Iceberg (is'berg), n. [D. ijsberg—ijs, ice, and berg, a mountain.] A hill or mountain of ice; specifically, a vast and lofty body of ice floating on the ocean. These lofty floating masses are generally detached from the seaward termination of glaciers on shore, though sometimes formed at a distance from any land. They are found in both the frigid zones, and are sometimes carried towards the equator as low as 40°. Masses of this sort abound in Baffin's Bay, where they are sometimes 2 miles long and one-half or one-third as broad. Scoresby counted 500 of these bergs drifting along in latitudes 60° or one-third as broad. Scoresby counted 500 of these bergs drifting along in latitudes 60° and 70° north, which rose above the surface of the sea to the height of from 100 to 200 feet, some of them a mile in circumference. It is computed that the depth of icebergs below the surface of the water is about eight times greater than the height above the water. Icebergs have been the agents in transporting large masses of mud, shingle, and rocks from the polar towards the tem-

Iceberg.

Some have been seen bearperate regions. perate regions. Some have been seen bear-ing cargoes of from 50,000 to 100,000 tons. As such masses float southward, the ice under water gradually melts away until the berg becomes top-heavy and capsizes, depo-siting its burden on the bottom of the sea. Several of the phenomena of the northern drift or boulder-clay are due to this agency. Several of the phenomena of the northern drift or boulder-clay are due to this agency. Ancient terraces or sea-margins, to be seen ligh up on our hill sides, are in part drift brought as cargo by icebergs, deposited where they stranded, and levelled and arranged by water. The gravel-knoils, which occur so frequently on our level lands, are also in some cases cargoes deposited where an iceberg stranded on a shoal or flat and melted, the hillocks rising to the surface with the gradual rise of the sea-bottom. Icebergs are agents in the denudation of the sea-bottom, doing their work sometimes at the depth of 1800 feet.

Idea (i-de'a), n. [L. idea; Gr. idea, from idein, to see.] 1. Form, image, model of anything in the mind; that which is held or comprehended by the understanding or intellectual faculties: as a philosophical term, now generally used to designate subjective notions and representations, with or without objective validity. For further information as to the significations in which this word has been used see extracts below.

I have used the word idea to express whatever is meant by phantasm, notion, species, or whatever it is which the mind can be employed about in thinking.

Whatever the mind perceives in itself, or is the immediate object of perception, thought, or understanding, that I call an idea.

Locke.

immediate object of perception, thought, or understanding, that I call an idea. Locke.

In popular language, idea signifies the same thing as conception, apprehension, notion. To have an idea of anything is to conceive it. In philasophitatizes, it does not signify that act of the mind which we call thought or conception, but some object of thought. Reid.

The great leading principle of the metaphysical department, and a principle which is never lost sight of nany part of the book (Hume's Treatise of Himman Nature), is, that the materials on which intellect works are the impressions, which represent immediate sensation, whether externally, as by the senses, or internally, as by the passions, and circa, which are the properties of the pool of the book of the control of the book of the properties of the part of the pool of the properties of the prop

This word (idea) is often applied to any kind of thought, or notion, or belief; but its more proper use is restricted to such thoughts as are images of visible objects, whether actually seen and remembered, or compounded by the faculty of imagination. The words notion or opinion would often be well substituted for the word ridea.

18. Taylor.

tuted for the word idea. A. Taylor. Plato agreed with the rest of the ancient philosophers in this—that all things consist of matter and form; and that the matter of which all things were made, existed from eternity, without form; but he likewise believed that there are eternal forms of all possible things which exist, without matter; and to those eternal and immaterial forms be gave the name of sédes. In the Platonic sense, then, ideas were the patterns according to which the Deity fashioned the phenomenal or extypal world.

9. Denvalenty, sides, significate action, except the patterns according to the phenomena.

2. Popularly, idea signifies notion, conception, thought, opinion, belief, and even purpose or intention; as, I had no idea it was so late; I have an idea that he will come to-morrow; he had an idea of going to London; he hadn't an idea in his head.—Immate ideas. Idealism (i-dē'al-izm), n. The name usually given to that system of philosophy, according to which nothing exists but the mind itself and ideas perceived by the mind, or

which maintains that we have no rational grounds for believing in the reality of anything but percipient minds, perceived ideas, and the relations of those ideas. Bishop Berkeley is regarded as the founder of modern idealism. According to this philosopher, all that really exists is spirit, or the thinking principle,—ourselves, our fellowmen, and God. Matter does not exist independently of our sensations or ideas, but conceptions of a material world are produced by the operation of the Deity upon our understanding, and the material world exists only in the Divine intellect, who awakens in us certain sensuous conceptions in a definite order, which order is what we call the course of nature. Some of the docwhich maintains that we have no rational call the course of nature. Some of the doctrines of the modern German idealists may be seen in the following extracts from

G. H. Lewes.

I see a tree. The common psychologists tell me that there are three things implied in this one fact of vision, viz.: a tree, an image of that tree, and a mind which apprehends that image. Fichte tells me that it is I alone who exist. The tree and the image of it are one thing, and that is a modification of my mind. This is subjective idealism. Schelling tells me that both the tree and my gro (or self) are existences equally read or ideal; but they are nothing less than manifestations of the absolute, the infinite, or unconditioned. This is objective idealism. But Hogel tells me that all these explanations are false. The only thing really existing (in this one fact of vision) is the idea, the relation. The gro and the tree are but two terms of the relation, and owe their reality to it. This is absolute idealism. According to this there is neither mind nor matter, heaven nor earth, God nor man.

He followed their language, but did not comply with the idiom of ours.

3. Dialect; peculiar form or variety of language.—Idiom, Idiotism. Mr. Marsh would distinguish these words as follows, but the second of them is really little used, idiom generally being employed instead. Idiom may be employed loosely and figuratively as a synonym of language or dialect, but in its proper sense it signifies the totality of the general rules of construction which characterize the syntax of a particular language and distinguish it from that of other tongues. Idiotism, on the other hand, should be taken to denote the systematic exemption of particular words, from the general syntactical rules of the language to which they belong; or, in a more limited sense, we may apply the same term to phrases not constructed according to native etymology and syntax, and whose meaning is purely arbitrary and conventional, and then they would properly be styled special diotisms. In a general way, the idiom of a language consists in those regular and uniform laws of grammatical construction which characterize its syntax; its idiotisms are abnormal and individual departures not only from universal grammar, but from its own idiom.

Hence the phrase, Ilias malorum, an Iliad of woes

which the poet exhibits the histeranic effects of disminor and public dissensions. Hence the phrase, *Ilias malorum*, an Iliad of woes or calamities; a world of disasters. The whole action of the poem is confined to the tenth and last year of the siege of Troy. Some critics maintain that the Iliad is not are horse-groups are more but a series of the second of the confined to the some critics maintain that the Iliad is not one homogeneous poem, but a series of ballads or rhapsodies on different episodes of the Trojan war either by one author (Homer) or by different poets, united somewhat loosely into a sort of coherent poem. On the assumption that Homer was the author of the different rhapsodies, it is equally disputed whether this union was effected by himself or by some one after him, as Pisistratus. On this theory of the Iliad being merely a congeries of ballads or rhapsodies strung together it is generally conceded that the ballad of Achilles, called the Achilleid, with which the Iliad is regarded as opening and closing, is the original and the main strain, from which by enlargement the Iliad was developed. See ACHILLEID.

Imagination (im-aj 'im-\(\frac{1}{2} \) in alg. an inagination, in [L. imagination, to form or reflect an image, from imago, imaginis, an image.] I. The power or faculty of the mind by which it conceives and forms ideas of things communicated to it by the organs of sense. Imagination, or faculty of the mind by which it conceives and forms ideas of things communicated to it by the organs of sense. Innapination, in its proper sense, according to Reid, signifies a lively conception of objects of sight. It is distinguished from conception as a part from a whole. The business of conception, 'says Stewart, 'is to present us with an exact transcript of what we have felt or perceived. But we have also a power of modifying our conceptions, by combining the parts of different ones so as to form new wholes of our own creation. I shall employ the word imagination to express this power. I apprehend this to be the proper sense of the word, if imagination be the power which gives birth to the productions of the poet and the painter. Innapination might be defined as the will working on the materials of memory; not satisfied with following the order prescribed by nature or suggested by accident, it selects the parts of different conceptions or objects of memory to form a whole more pleasing, more elevated, more

sublime, more terrible, or more awful than has ever been presented in the ordinary course of nature. The term is often employed course of nature. The term is often employed in a narrow acceptation as synonymous with fancy, which properly is only a lower or slighter development of the imaginative faculty. In its widest signification, however, imagination is co-extensive with invention, furnishing the writer with whatever is most happy and appropriate in language, or vivid and foreible in thought.

and foreithe in thought.

The power of the mind to decompose its conceptions, and to recombine the elements of them at its pleasure, is called its faculty of imagination.

To bring into connection with; to show or prove to be connected or concerned; as, the evidence does not implicate the accused person in this conspiracy.—Implicate, Involve, Entangle. Implicate and involve are similar words, but with a marked difference. The first means to fold into a thing: the second to roll into it. What is folded, however, may be folded but once or partially; what is involved is rolled many times. Hence men are said to be implicated, when they have taken but a small share in a transaction: they are said to be involved when they are deeply concerned. Criminal charges are generally clear and soon settled; men are implicated in them. Law suits and debts are intricate and embarrassing, and those who are involved find it hard to get free. Angus. Implicate is always used of persons; involve may be used of persons or things, both words being always metaphorically employed. Entangle is used literally or metaphorically, and signifies to involve so that extrication is a matter of extreme difficulty. Implication (im'pli-kā'shon), n. With men this is impossible; but with God all things are possible. Mat. xix, 26.

are possible. Mat. xix. 26.
What may be called a mathematical impossibility is that which involves an absurdity and self-contradiction; e.g., that two straight lines should inclose a space is not only *xipassible* but inconceivable, as it would be at variance with the definition of a straight line. And it should be observed that inability to accomplish anything which is, in this sense, impossible, implies no limitation of power, and is compatible even with ominpotence in the fullest sense of the word. Abp. Whately, potence in the fullest sense of the word. Alp. Wrately.

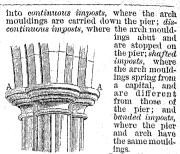

—Impossible quantity, in math. an imaginary quantity. See InaGinary.—Impossible means that a thing cannot be effected or even supposed to be effected, being theoretically as well as practically incapable of accomplishment; while impracticable refers rather to a thing so hard to effect by reason of difficulties that its accomplishment is beyond our power. Thus, it may be impracticable to extort money from a miser, but it is not impossible; or the construction of a railway over a morass may be impracticable, but not impossible, if all considerations of outlay are thrown aside. It has been said that are thrown aside. It has been said that 'nothing is *impossible*, but many things are *impracticable*.'

angle of inclination. In optics, the line of direction in which a ray is propagated, as AB, is called the line of incidence, or the incident ray, and the point B where an incident ray meets the reflecting or refracting surface is called the point of incidence. Also, BH is called the axis of incidence. It is a fundamental principle in optics that the angle of incidence ABH is caused for the profile of reflection HBB where optics that the angle of incidence ABH is equal to the angle of reflection HBC, where AB is the incident ray and BC the reflected ray. (See REFLECTION.) When an elastic body strikes a hard and fixed plane it rebounds from the plane, making the angles of incidence and reflection equal.

Incline (in-klin'), n. An inclined plane; an ascent or descent, as in a road or railway;

a slope. Inclined (in-klind'), p. and a. 1. Having a leaning or tendency; disposed.—2. In bot. curved with the convex side up.—Inclined plane, in mech. a plane inclined to the horizon, or forming with a horizontal plane any angle whatever excepting a right angle. It is one of the mechanic powers. The figure

A BC represents an inclined plane; A C is the plane properly so called; C B the height of the plane, BA its base, and BAC the angle of inclination or elevation. The power necessary to sustain any weight on an inclined plane is to the weight as the height of the plane to its length, or as C B to CA. Hence, the less the height of the plane in proportion to its length, or the less the angle of inclination, the greater the mechanical effect. The inclined plane enables us to raise a given weight along an inclined surface to a given elevation with less expense of force than would be required to raise it perpendicularly to the same elevation.

Indigo (in'digo), n. [Sp. and It. indigo, from L. indigo, from Indiao, Indian, from Indiao.] A well-known and beautiful blue vegetable dye, extensively employed in dyeing and calico printing. The indigo of commerce is almost entirely obtained from leguminous plants of the genus Indigofera, that cultivated in India being the 1. tinctoria, and that in America the 1. Anti. The plant is bruised and fermented in vats of water, during which it deposits indigo in the form of a blue powder, which is collected and dried so as to form the cubic cakes in which it usually occurs in commerce. In this state it has an intensely blue colour and earthy fracture, the kind most esteemed being that which, when rubbed by a hard body, assumes a fine copper-red polish. Indigo is quite insoluble in water, but when exposed to the action of certain deoxidizing agents it becomes soluble in alkaline solutions, losing its blue colour, and forming a green solution, from which it is precipitated by the acids white, but it instantly becomes blue by exposure to air. The indigo of commerce, besides some earthy matter, consists of indigo-blue, indigo-red, indigo-brown, and glutinous matter.—Indigo blue, or, as it has been called, indigotin, may be prepared from commercial indigo by treating it with dilute acids, alkalies, and alcohol; it is generally prepared by acting with reducing agents upon indigo-white. Indigotin has the formula CloH₃NO₂. It forms fine right rhombic prisms which have a blue colour and metallic lustre. It is soluble in strong sulphuric acid; the solution has an intense blue colour, and is employed occasionally in dyeing, under the name of Savon or livnid blue.— Lotdigo had not and metallic lustre. It is soluble in strong sulphuric acid; the solution has an intense blue colour, and is employed occasionally in dyeing, under the name of Savon or livnid blue.— Lotdigo had not and metallic lustre. It is soluble in stro strong sulphure acid; the solution has an intense blue colour, and is employed occasionally in dyeing, under the name of Saxon or liquid blue.—Indigo white, indigo obtained by subjecting commercial indigo to the action of reducing agents, such as alkaline fluids containing sulphate of iron, an arithment of concaveration alacked. alkaline fluids containing sulphate of iron, or a mixture of grape-sugar, alcohol, and strong soda lye. Reduced indigo forms a yellow solution in alkaline fluids, but, on free exposure to the air, absorbs oxygen and is reconverted into indigo-blue. This is the best method of obtaining the latter in a pure state, whence indigo-white is called also Indigogen.—Egyptian indigo, a leguminous plant, the Tephrosia apollinea, a native of Egypt. It is narcotic, and yields a fine blue dye. The leaves are occasionally mixed with Alexandrian senns, and the plant is commonly cultivated for its indigo in Nubia. See Indigo-Plant.

4. In logic and philos. (a) the method of
reasoning from particulars to generals, or
the inferring of one general proposition from
several particular ones; a process of demonstration in which a general fruth is gathered
from an examination being so conducted that
each case is made to denend mon the preseveral particular ones; a process of demonstration in which a general fruth is gathered from an examination of particular cases, the examination being so conducted that each case is made to depend upon the preceding one. Induction, as defined by Archishiop Whately, is a process of reasoning which infers respecting a whole class, what has been eascertained respecting one or more individuals of that class. According to Sir William Hamilton the word has been employed to designate three very different operations; (1) the objective process of investigating particular facts as preparatory to induction, which, he observes, is manifastly not a process of reasoning of any kind. (2) A material illation of a universal from a singular, as warranted either by the general malogy of nature, or the special presumption afforded by the object matter of any real science. (8) A formal illation of a universal from the individual as legitimated solely by the laws of thought, and abstracted from the conditions of any particular matter. The second of these operations is the inductive method of Bacon, which proceeds from particulars to generals, and from generals to still higher generalities, by means of rejections and conclusions, so us to arrive at those axioms and general laws, from which we may infer, by way of synthesis, other particulars tanknown to us, and perhaps placed beyond the reach of direct examination. When general principles have once been established by induction, they can be employed as first truths or axioms, and applied to particular instances. This method reverses the order of the inductive process, as it proceeds from generals to particulars, and is termed devactive reasoning; thus, having once established the general principle. (b) The conclusion or inference drawn from premises or from propositions which are admitted to be true, either in fact or for the sake of argument.— En physics, the property by which one body, having electrical, galvanic, or magnetic polarity, causes or induces in impress of molecular for

produce temporary currents; the other, the produce temporary currents; the other, the secondary coil, is wound round the first, but carefully insulated from it, and in it is generated a current by induction every time the current begins or stops in the primary coil. The currents produced by induction possess high power of overcoming resistance as well as great quantity; and hence very intense effects, chemical, physiological, and luminous, are obtainable from them.

pseudopodia, but are furnished with vibra-tile cilia. Most are free-swimming, but some

form colonies by budding, and are fixed to a solid object in their adult condition. The body consists of an onter transparent cuticle, a layer of firm sarcode called the cortical layer, and a central mass of semiliquid sarcode which acts as a stomach. A nucleus, which is supposed to be an ovary, having attached to its outside a spherical particle called the nucleolus, and supposed to be a spermatic gland, is imbedded in the cortical layer. Contractions of the body are effected by sarcode fibres. The cilia, with which most are furnished, are not only organs of locomotion, but form currents by which food is carried into the mouth. Reproduction takes place variously. They are divided into three orders, Ciliata, Suctoria, and Flagellata, in accordance with the character of their cilia or contractile filaments. spiration is effected by means of air-tubes or tracheæ, and in most insects two pairs of wings are developed from the back of the second and third segments of the thorax. The integument is more or less hardened by the deposition of chitin in it. The head is composed of several segments amalgamated together, and carries a pair of jointed feelers or antennæ, a pair of eyes, usually compound, and the appendages of the mouth. The thorax is composed of three segments, also amalgamated, but generally pretty easily recognized. Insects are all produced from eggs. They have been divided into three sections—Ametabola, Hemimetabola, and Holometabola, according as they remain always the same or undergo an incomplete or complete metamorphosis. The Ametaor complete metamorphosis. The Ameta-bola do not pass through metamorphosis, and differ from the adult only in size. They are all destitute of wings; the eyes are

simple and sometimes wanting. The Hemi-metabola undergo an incomplete metamor-phosis, the larva differing from the imago chiefty in the absence of wings and in size. The pupe is usually active, or if quiescent capable of movement. In the Holometa-bola the metamorphosis is complete, the larva, pupe, and imago differing greatly from one another in external appearance and habits. The larva is wormlike, and the

Instinct (in'stingkt), n. [L. instinctus, in-

stigation, impulse from instinguo, instinctum, to impel—in, on, and stinguo, to prick, same root as in sting, stick.] I. In its widest sense, the power or energy by which all organized forms are preserved in the individual or continued in the species. In this sense it has been applied to plants as well as to animals, but it is more common to consider instinct as belonging to animals, in which case it is defined as a certain power by which, independently of all instruction or experience and without deinstruction or experience and without de-liberation, animals are directed to do sponilberation, animals are directed to do spontaneously whatever is necessary for the preservation of the individual or the continuation of the kind. Such, in the human species, is the instinct of sucking exerted immediately after birth, and that of insects in depositing their eggs in situations most favourable for hatching. Instinct makes animals provide for themselves and young, and utter those voices, betake themselves to that course of life, and use those means of self-defence, which are suitable to their circumstances and nature. The nest of the bird, the honey-comb of the bee, the web of the spider, the threads of the silkworm, the holes or houses of the beaver, are all executed by instinct, and are not more perfect now than they were long ages ago. In the cuted by instinct, and are not more perfect now than they were long ages ago. In the beginning of life we do much by instinct and little by understanding; and even when arrived at maturity, there are innumerable occasions on which, because reason cannot guide us, we must be guided by instinct. The complex machinery of nerves and muscles necessary to swallowing our food, walking, &c., is set agoing by instinct. The motion of our eyelids, and those sudden motions which we make to avoid sudden danger, are also instinctive.

(An justified) is a processity prior to experience

2. A clashing or collision; the act of coming into violent contact with; specifically, in farriery, a striking of one foot against the other.—3. In physics, the mutual action of waves of any kind (whether those in water, or sound, heat, or light waves) upon each other, by which, in certain circumstances, the vibrations and their effects are increased, diminished, or neutralized. The term was first employed by Dr. Young to express certain phenomena which result from the mutual action of the rays of light on each other. When two minute pencils of light, radiating from two different luminous points, and making a small angle with each other, fall upon the same spot of a screen or a piece of paper, they are found to act upon each other, producing different effects, which depend upon certain differences between the lengths of the two pencils. Il m some cases the pencils filluminate the paper or screen more strongly than either would have done singly, and sometimes they destroy each other's effects and produce a black spot or fringe. The phenomena of the interference of rays have been explained in accordance with the undulatory theory of light, and furnish a strong argument in favour of that theory.
